

The Reading Nook

Accessibility Evaluation - COMP 584 Homework 3

Leslie Cruz | WAVE Chrome extension | September 25, 2026

Purpose and method

I evaluated my Reading Nook email campaign using the WAVE Chrome extension, reviewed the flagged findings, made HTML/CSS changes, and ran WAVE again. I also tested the CSUN homepage as a comparison and checked my campaign in Chrome mobile device emulation. WAVE results are snapshots of the tested pages, not comprehensive accessibility certifications.

Reading Nook: before and after

WAVE category	Initial	Retest
Errors	1	0
Contrast errors	6	3
Alerts	2	1
Features	2	2
Structural elements	5	6

Initial findings: WAVE identified an empty or uninformative page title, six very-low-contrast instances, and two alerts: no page regions and a layout table. It also detected alternative text and page language.

Changes made: I added a descriptive page title, darkened green text, and identified the main content. On retest, WAVE reported zero errors, three contrast errors, and one alert. The remaining alert is the layout table, which is intentionally used for this email assignment. Three contrast findings still require review.

Accessibility tool: advantages and limitations

Advantages: WAVE visually marks affected elements, distinguishes errors from alerts, identifies contrast concerns, and can evaluate a locally opened page using the browser extension.

Limitations: Automated checks do not cover every accessibility requirement; alerts require manual judgment. A Chrome test does not prove that HTML email renders or behaves the same in Gmail, Outlook, or Apple Mail.

Comparison website: CSUN homepage

Page tested: <https://csun.edu> (as shown in the WAVE screenshot). Results: 0 errors, 9 contrast errors, 18 alerts, 29 features, 54 structural elements, and 55 ARIA items.

WAVE grouped the CSUN alerts as two possible headings, four links to PDF documents, five noscript elements, five redundant title text items, one HTML5 video/audio item, and one YouTube video. These are review prompts, not necessarily 18 confirmed failures. The nine contrast findings indicate color combinations to inspect.

This comparison shows that a page can report zero WAVE errors while still having contrast findings and alerts. The CSUN homepage is a larger, different kind of page, so the raw counts are not a direct accessibility ranking against my email.

Responsive browser preview

I previewed the Reading Nook in Chrome mobile device emulation at iPhone SE size (375 x 667). The screenshot shows the heading and circular hero image fitting the narrow viewport. I also reviewed the desktop layout. This is a browser preview, not a test in an actual email client.

Conclusion

The Reading Nook WAVE retest improved from 1 to 0 errors, 6 to 3 contrast errors, and 2 to 1 alerts. The remaining contrast issues should be inspected individually. The layout-table alert is documented because a table-based layout is part of the assignment.
